
**Prepared Corpus handoff from the data pipeline**
Frozen train / validation / test files and rare CSVs database SHA-256, statistics and audit records
For each training budget ordered 20% / 40% / 60% / 80% / 100% prefix training-only vocabulary; validation and test remain fixed
Neural fitting FFNN-1 / FFNN-2 / LSTM training gradients; validation NLL selects the checkpoint
Shared n-gram counting pass bigram and trigram × MLE / add-one / backoff
Complete-training rare-list inputs raw zero-count bigrams and trigrams produced from the combined held-out validation and test partitions
Primary complete-test evaluation same mapped word and EOS targets within each budget test data never selects model parameters
Occurrence-weighted rare-sequence evaluation bigram ↔ FFNN-1; trigram ↔ FFNN-2 LSTM retained as a context-truncated diagnostic
Retained experiment evidence checkpoints, configurations, histories, metrics, predictions and available event artifacts
Offline tables, figures and audits generated from retained outputs without retraining
